# Swine production research: How to implement and extract value Matt Allerson, DVM, PhD Holden Farms, Inc. Science-driven solutions<sup>®</sup>

## About myself....

**HOLDEN** farms

- DVM: University of Minnesota
- PhD: University of Minnesota Influenza A virus epidemiology

Science-driven solutions

- Holden Farms, Inc. (Northfield, MN, USA)
  - Veterinarian and research lead (2009-current)

### Holden Farms today

- Based in Northfield, MN, USA
- 100% Family Owned
  - 5<sup>th</sup> Generation
- Primary focus is the hog division
  - Sell ~1.7 million hogs/year
  - Also sell ~500,000 turkeys/year
  - Half owner of Daisyfield Packing in Sandusky, Ohio ~ 800,000 hogs/year

HOLDEN FARMS

#### Holden Farms territory/area

#### Market hogs - Sales growth

#### Sow inventory

#### Commitment to outside learning/research

## Research – why does HFI invest in research?

- To make evidence based decisions within the HFI system
  - Economics, performance
  - Similar barn, HFI pigs, feed, etc.
  - Allows for timely implementation of system specific ideas/trials
  - Since Mid-1990's
    - ~200 nursery trials
    - ~100 finishing trials
- What types of trials do we conduct?
  - Feed trials
  - Genetic trials
  - Management trials
  - Health, vaccine, medication

Science-driven solutions<sup>®</sup> HOLDEN farms

## Facility design – what is required?

- Ability to weigh each pen of pigs
  - Weight
  - Average daily gain
- Ability to track the amount of feed used per pen
  - Feed intake
  - Feed conversion
- Ability to track pigs removed
  - Removal and mortality %
     Science-
  - Treatment %
- Carcass/plant level data?

	Holding														

-96 pens of 25 pigs that can be used for research
-Adjustable gating (space trials/removals)
-6 water lines per pen

-All pigs are weighed on this scale approximately every 7-14 days -This allows us to calculate average daily gain and average weight by pen

-96 pens/48 feeders of 25-35 pigs that can be used for research
-Multiple water lines per pen
-Feedlogic feeding system

![](_page_15_Picture_1.jpeg)

![](_page_16_Picture_0.jpeg)

## Which trials do you conduct?

- 1. Potential value to the system
  - Economic return
- 2. Ability to implement in a system
  - Can it actually be accomplished system wide?
- 3. System specific issues that cannot be answered otherwise
  - Health (specific vaccines or medications)

Science-driven solutions<sup>®</sup>

![](_page_17_Picture_8.jpeg)

#### Who is involved in the decision making?

- 1. Production (sow and nursery/grow-finish)
- 2. Veterinary
- 3. Nutrition
- 4. Leadership team (economics, future company direction)

Science-driven solutions<sup>®</sup>

#### Major areas of trials conducted

- 1. Feed/nutrition
- 2. Genetics
- 3. Health, vaccine, medication
- 4. Management

Science-driven so

![](_page_19_Picture_6.jpeg)

## Trial example

- Genetic trial (sire line)
- Sire line A vs. B vs. C

![](_page_20_Picture_3.jpeg)

E CUL

Science-driven solutions<sup>®</sup>

## Trial example

- What are the treatments?
  - Sire line (A, B, C)
- What are the outcomes of interest?
  - Pig weight
  - Average daily gain
  - Average daily feed intake
  - Feed conversion
  - Mortality %
  - Removal %
  - Carcass characteristics
    - Yield, backfat, etc.

![](_page_21_Picture_12.jpeg)

## Trial example - Planning

#### • Sow farm

- Breeding protocol for sire lines
- Breeding timeline to match opening in the wean to finish site
- Other considerations
  - Balance EBV/CBV across sire lines
  - Balance sow parity across sire lines
  - Balance breeding dates by sire line (birth/wean age)
     Science-driven solutions<sup>®</sup>

![](_page_22_Picture_8.jpeg)

### Trial example - Identification

- Identification
  - Ear tag or other identifier to confirm treatment group at birth (sire line)
    - Individual ID helps to track other variables
      - Sow parity
      - Birth date
      - Wean age

![](_page_23_Picture_7.jpeg)

#### Trial example – site placement

- Control for other variables known to affect your outcomes of interest
  - Wean age
  - Barrow/gilt/boar
  - Space allowance
  - Area of the barn
  - Feeder space
  - Water type
  - Medications
  - Diet

#### Trial example – Data collection

- Determine your period and frequency of data collection
  - Weekly to bi-weekly until marketing
- Data collection
  - Pen weight
  - Pen count
  - Feed delivered to each pen
  - Feed remaining in each feeder
  - Removals
     Science-driven solutions<sup>®</sup>
  - Mortality
- Validate all data soon after data collection

#### Trial example – Data analysis

- Determine the type of analysis needed
  - Varies based on the trial type/design
- What is biologically significant to the system?
- What is economically significant to the system?
- Economic simulationsScience-driven solutions<sup>®</sup>
  - High market price, low feed cost
  - Low market price, high feed cost

#### Example -Results

	Treatment (sire line)	Α	В	С
	Average of weight P0	12.74	10.94	12.47
	Average of wt P14	307.7	298.9	306.9
	Average of ADG P014	1.77	1.73	1.79
	Average of ADF P014	4.18	4.09	4.21
4	Average of FG P014	2.36	2.36	2.36
	Average of Total removals %	16.9%	16.9%	9.9%
	Average of Mortality %	2.7%	2.6%	3.3%
1	Average of Removals %	14.2%	14.3%	6.6%
Sc	Average of feed cost/pig	\$78.07	\$74.02	\$82.80
JU	Average of revenue/pig	\$125.06	\$121.24	\$135.08
	Average of IOFC/pig	\$46.98	\$47.22	\$52.27

#### Summary

- Production research farms and teams can provide timely answers to system specific questions
- Economic value can be realized in different ways
  - Not using an ineffective product (cost savings)
  - Production improvement (increased IOFC)
- Understand your systems opportunities and needs
- Provide the best barn set-up and invest in people to help
